West Nile Virus Surveillance Report

Center for Acute Disease Epidemiology | Acute Disease Prevention and Emergecy Response | West Nile Virus Website

Date Issued: September 10, 2013

Overview:

Eleven human cases of West Nile Virus have been reported in Iowa in 2013 and additional cases are being investigated. In 2012, there were 31 human cases of West Nile Virus reported. Six positive blood donors have been reported so far this year. Three sentinel chickens, eighteen mosquito pools and five horses have also tested positive for West Nile Virus.

Human / Sentinel Chicken / Mosquito Surveillance, 2013 Positive Samples

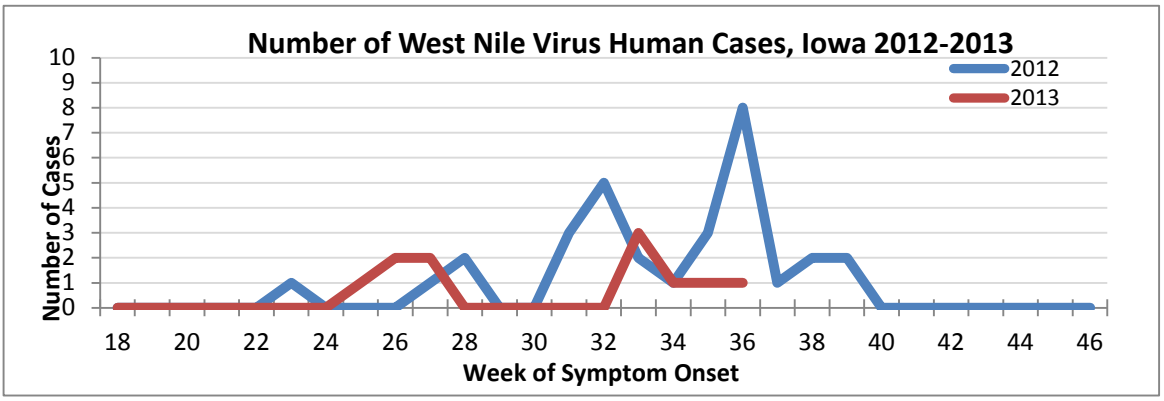

Figure 1. Number of West Nile Virus Human Cases – Iowa, 2012-2013

West Nile Virus is endemic in Iowa and activity usually peaks in late summer and early fall. Local partners collect mosquitoes and maintain sentinel chicken flocks across the state. Iowa State University Medical Entomology monitors the levels of *Culex pipiens* and *Culex tarsalis* mosquitoes (the primary vectors of WNV) statewide and the State Hygienic Laboratory (SHL) tests the mosquitoes to determine whether they are infected with West Nile Virus or other arboviruses. SHL also tests the blood drawn from sentinel chickens weekly to determine whether they have been infected with West Nile virus or other arboviruses.

For additional on Iowa West Nile Virus activity, visit:
www.idph.state.ia.us/Cade/DiseaseIndex.aspx?disease=West Nile Virus.

National WNV Activity:

Nationally, as of September 3rd , 672 counties in 45 states and the District of Columbia have reported WNV activity for 2013, including 36 states with reported WNV infections (i.e., disease cases or viremic blood donors) and 10 additional states with reported WNV activity in non-human species only (i.e., veterinary cases, mosquito pools, dead birds, or sentinel animals)

To date, a total of 497 human cases of WNV disease have been reported from 36 states. Of all WNV disease cases reported, 243 (49%) were classified as neuroinvasive disease (e.g., meningitis, encephalitis, acute flaccid paralysis) and 254 (51%) as non-neuroinvasive disease. Dates of illness onset for disease cases ranged from February – August.
