
Mosquito populations (as collected in New Jersey Light Traps) are shown for the state of Iowa in 2005 and 2006. These traps attract mosquitoes drawn to light, and so measure the number of mosquitoes (male and female) that are active from dusk-dawn. The mosquitoes shown are generally pest species (*Aedes* species, left axis) or disease carrying species (*Culex* species, right axis). Traps run in 12 counties in the state, each of which has 2-5 traps. In order to plot results in a manner that facilitates comparison, the total number of mosquitoes trapped throughout the state is divided by the number of traps running x number of nights during which traps ran. The species and numbers of mosquitoes trapped are detailed in the tables that follow.
